Soares, L. S.; Lopes, B. G.; Almeida, J. M.; Prates, R. O.; Gonçalves, M. A.
Are All Instances Equally Explainable? A Study on the Impact of Locality on the Explainability of Automatic Text Classification Tasks.
Accepted at the 4th World Conference on Explainable Artificial Intelligence (XAI 2026).

Questionnaire Structure

The questionnaire presented here corresponds to the instrument used in the user survey conducted for this study. It includes both open-ended and multiple-choice questions and is organized into two main parts:

- *Participant Profile*: This part consists of demographic questions designed to identify participants' profiles.

| Participant profile |

Age:

( ) under 18
( ) 18-24
( ) 25-30
( ) 31-35
( ) 36-40
( ) 41-45
( ) 46-50
( ) over 50

Gender:
( ) Female
( ) Male
( ) I prefer not to say

Main area of education or professional activity:
( ) Computer Science, Information Technology, Information Systems, and related fields
( ) Engineering
( ) Mathematics or Statistics
( ) Other

Do you have any experience in Machine Learning, whether working, studying, or researching:
( ) Yes
( ) No

How long have you been involved in the field of Artificial Intelligence, whether working, studying, or researching in the area:
( ) Less than 1 year
( ) 1 to 2 years
( ) 3 to 5 years
( ) More than 5 years

Considering the subfield of Machine Learning, in which of the following activities do you have practical experience (select all applicable options):
( ) Data preprocessing
( ) Model building, including parameter tuning and validation
( ) Using models for classification tasks
( ) Interpreting models using interpretability approaches or tools
( ) None of the above
( ) Other

- *Word Clouds Evaluation:* This section begins with a brief guide explaining the questionnaire and the dataset labels (AGNews / ACM). For each dataset, the survey contains 16 evaluation stages, corresponding to the 16 sampled instances in the dataset. In each stage, two clouds are presented for evaluation (*locality* and *attention* word clouds, randomized throughout the stages). Each evaluation stage follows the structure outlined below:

The two word clouds are explanations for the CLASSIFICATION provided by the model for the following text:

<Title>
<Text>
<Classification>
<Class Description Guide *>

Figure 1: *Generic word cloud for illustrative purposes only (not used in the study).

Regarding the quality of the word cloud, as an explanation for the CLASSIFICATION provided by the model

	Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree	Cannot Evaluate
The explanation helped me understand why the model chose this class.	○	○	○	○	○	○
The highlighted words are relevant to the class presented.	○	○	○	○	○	○
After seeing this explanation, I feel comfortable with the classification provided by the model.	○	○	○	○	○	○

Which aspects of the word cloud influenced your response (Optional)?

Figure 2: *Generic word cloud for illustrative purposes only (not used in the study).

Regarding the quality of the word cloud, as an explanation for the CLASSIFICATION provided by the model

	Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree	Cannot Evaluate
The explanation helped me understand why the model chose this class.	○	○	○	○	○	○
The highlighted words are relevant to the class presented.	○	○	○	○	○	○
After seeing this explanation, I feel comfortable with the classification provided by the model.	○	○	○	○	○	○

Which aspects of the word cloud influenced your response (Optional)?

In your opinion, which of the word clouds offers the best explanation for the CLASSIFICATION assigned to the text?
( ) | WORD CLOUD 1 |
( ) | WORD CLOUD 2 |
( ) The word clouds are equivalent
( ) Cannot evaluate

Would you like to evaluate another word cloud?
( ) Yes
( ) No, I intend to end my participation.

(*)Class Description Guide

AGNews Dataset. Contains short news texts. The model identifies the main topic of each document among four categories:

- **Sports**: News related to sports, athletes, competitions, championships, and other sporting events, either in a global or national context.
- **Science/Technology**: News about technology, innovations, gadgets, research, and developments in the fields of science and technology.
- **World**: News concerning international events, politics, and other global or country-specific affairs.
- **Business**: News related to economics, financial markets, companies, and other business-oriented topics.

ACM Dataset. Comprises research texts related to Computer Science. This survey considers four of the eleven categories available in the original dataset:

- **Information Systems**: Studies on the design, development, and application of information systems, including collaborative systems, decision support systems, enterprise systems, web systems, e-commerce, geographic information systems (GIS), databases, queries, data storage, interactive interfaces, and digital libraries.
- **Hardware**: Studies on the physical components and architecture of computing systems, covering circuit design, microprocessors, electronic devices, and performance optimization techniques.
- **Software Engineering**: Studies on software development, including object-oriented projects, programming languages, modeling, testing, validation, reuse, configuration management, code quality, and development support tools.
- **Theory of Computation**: Studies on the mathematical and logical foundations of computing, including algorithms, computability, computational complexity, automata, formal languages, logic, and theoretical cryptography.
